Title

Imidazoles for the Treatment of Atherosclerosis

Cross-Reference to Related Application

This application is a continuation-in-part of U.S.S.N. 07/416,606 filed October 10, 1989, which is a continuation-in-part of U.S.S.N. 07/279,981, filed December 5, 1988, both of which are incorporated herein by reference.

Field of the Invention

This invention relates to imidazoles as inhibitors of acyl-CoA: cholesterol acyltransferase (ACAT), pharmaceutical compositions containing them, processes for their preparation, and their use as antihypercholesterolemic and/or antiatherosclerotic agents.

Background of the Invention

Hypercholesterolemia is an established risk factor in the development of atherosclerosis. Therapeutic agents which control the level of serum cholesterol have proven to be effective in the treatment of coronary artery disease. While agents exist that can modulate circulating levels of cholesterol carrying lipoproteins, these agents have little or no effect on the intestinal absorption of cholesterol. Dietary cholesterol can increase the level of serum cholesterol to levels which place an individual at increased risk for the development or exacerbation of atherosclerosis. Since much of the free or unesterified cholesterol that is absorbed by intestinal mucosal cells must first be esterified by ACAT prior to its incorporation and secretion into the bloodstream in large lipoprotein particles called chylomicrons, inhibition of ACAT can reduce the absorption of dietary cholesterol. In addition, the accumulation and storage of cholesteryl

esters in the arterial wall is associated with increased activity of ACAT. Inhibition of the enzyme is expected to inhibit the formation or progression of atherosclerotic lesions in mammals.

There are a limited number of patents in the literature disclosing compounds which are useful as ACAT inhibitors in particular and antiatherosclerotic agents in general. For example, U.S. Patent No. 4,623,662, issued to De Vries on November 18, 1986, discloses ureas and thioureas as ACAT inhibitors useful for reducing the cholesterol ester content of an arterial wall, inhibiting atherosclerotic lesion development, and/or treatment of mammalian hyperlipidemia. U.S. Patent No. 4,722,927, issued to Holmes on February 2, 1988, discloses disubstituted pyrimidineamides of oleic and linoleic acids as ACAT inhibitors useful for inhibiting intestinal absorption of cholesterol.

There are no known literature references disclosing the imidazoles of this invention, their use as ACAT inhibitors, or their use to lower cholesterol or in the treatment of atherosclerosis.

The compounds of this invention are very potent ACAT inhibitors. As shown by the data presented below in Table 6, the compounds of this invention inhibit ACAT activity in vitro with at least ten times the potency of any ACAT inhibitors described in the current literature. As shown by the data presented below in Table 8, the compounds of this invention cause a reduction in the serum cholesterol level in cholesterol-fed hamsters. The compounds of this invention are thus expected to be useful in pharmaceutical formulations for the treatment of atherosclerosis. The compounds of this invention have been shown to lower serum cholesterol, and this invention should not be construed as limited to any particular antihypercholesterolemic mechanism of action.

Detailed Description of the Invention

Synthesis

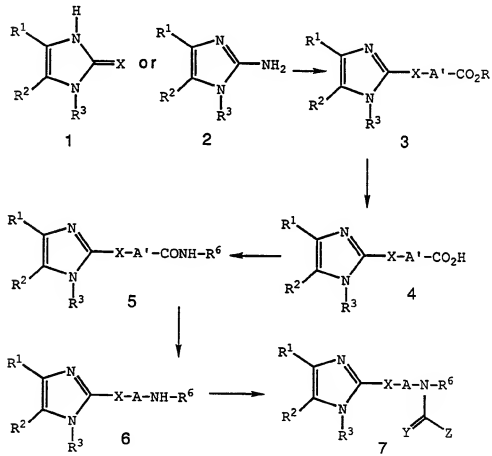
The novel compounds of Formula (I) may be prepared using the reactions and techniques described in this section. The reactions are performed in solvents appropriate to the reagents and materials employed and suitable for the transformation being effected. It is understood by those skilled in the art of organic synthesis that the functionality present on the imidazole and other portions of the molecule must be compatible with the reagents and reaction conditions

proposed. Not all compounds of Formula (I) falling into a given class may be compatible with some of the reaction conditions required in some of the methods described. Such restrictions to the substituents which are compatible with the reaction conditions will be readily apparent to one skilled in the art and alternative methods described must then be used.

The compounds of Formula (I) wherein X is O, S or NH can be prepared by the route shown in Scheme 1. The esters of Formula (3) wherein X is O or S can be prepared by converting the requisite 4-imidazolin-2-one (1) where X is O, or 4-imidazolin-2-thione (1) where X is S, into the corresponding alkali metal salt by addition of a base such as sodium hydride, and the salt is alkylated with a compound of the formula M-(A')CO_2R, wherein R is CH_3 or C_2H_5, M is a halogen or a tosylate group, and A' is a moiety having one less methylene group than A, in a polar solvent such as N,N-dimethylformamide. Alternatively, the esters of Formula (3) wherein X is S may be prepared by direct alkylation of the requisite 4-imidazolin-2-thione with M-(A')CO_2R, without the addition of a suitable base, in a polar solvent such as N,N-dimethylformamide at a temperature from ambient temperature to the reflux temperature of the solvent. The esters of Formula (3) wherein X is NH can be prepared by the reaction of the requisite 2-aminoimidazole of Formula (2) with a compound of the formula M-(A')CO_2R wherein R, M, and A' are as defined above, in a suitable solvent such as N,N-dimethylformamide. Compounds of Formula (2) wherein R^3 is H are preferentially alkylated at a ring nitrogen atom. Therefore, in order to prepare compounds of Formula (I) wherein X is NH and R^3 is H, it is usually necessary to protect the ring nitrogen atom. The

protecting group is preferably stable under basic conditions and easily removed under acidic conditions, e.g., a silyl or trityl group. The protected 2-aminoimidazole can then be used to prepare esters of Formula (3) wherein R^3 is a protecting group. The protecting group can be removed at any suitable stage in the synthetic sequence for the preparation of the compounds of Formula (I) wherein X is NH and R^3 is H.

Scheme 1



The esters of Formula (3) are hydrolyzed to the corresponding carboxylic acids of Formula (4) by methods which are well known in the chemical literature. For

example, the hydrolysis can be accomplished by reaction with an alkali metal hydroxide in aqueous or organic solvents such as water, alcohols, ethers or mixtures thereof, followed by acidification with a mineral acid. The methods used to prepare compounds of Formula (4) are substantially similar to the methods described in U.S. 4,654,358, U.S. 4,460,598 and in co-assigned Application U.S. Serial No. 244,170 (BP-6339) filed September 14, 1988, the teaching of which is incorporated by reference. Compounds of Formula (4) wherein R^1 and R^2 are phenyl or substituted phenyl, R^3 is H, X is S, A' is $(CH_2)_{n-1}$ and n is 8 to 21 are claimed as antihypercholesterolemic compounds in co-assigned application, U.S.S.N. 244,170 (BP-6339).

The amides of Formula (5) are prepared by coupling the carboxylic acids of Formula (4) with a primary amine by amide bond forming reactions which are well known in the chemical literature. One method for amide bond formation is to use a coupling reagent which generates a reactive intermediate such as a mixed anhydride or active ester. Examples of such coupling agents are disubstituted carbodiimides, N,N'-carbonyldiimidazole, diphenylphosphoryl azide, and the like. For example, the coupling can be carried out with a disubstituted carbodiimide such as dicyclohexylcarbodiimide in an appropriate solvent such as methylene chloride, acetonitrile, toluene, or N,N-dimethylformamide. Nucleophilic hydroxy compounds such as 1-hydroxy-1H-benzotriazole, which form highly active esters, may be added to catalyze the reaction.

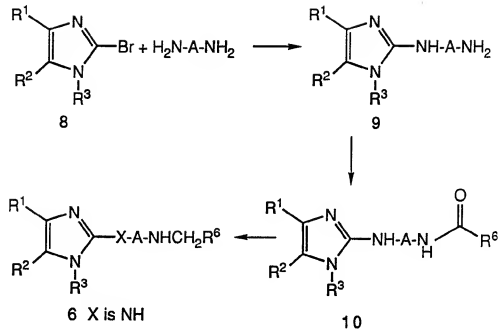
There are several alternate approaches to the preparation of the amides of Formula (5). For example, the boron trifluoride etherate catalyzed reaction of the carboxylic acids of Formula (4) with a primary amine,

with azeotropic removal of water, affords the amides of Formula (5). Another approach is to convert the carboxylic acids of Formula (4) to the corresponding acid chloride using thionyl chloride, oxalyl chloride or the like and then to react the acid chloride with a primary amine in the presence of a base such as triethylamine to afford the amides of Formula (5). Alternatively, the esters of Formula (3) can be directly converted to the amides of Formula (5) by ester aminolysis in the presence of strong alkali metal catalysts such as sodium amide, sodium hydride, sodium methoxide, Grignard reagents or butyllithium, or in the presence of milder catalysts such as 2-pyridone, boron tribromide, or dimethylaluminum amides.

The amines of Formula (6) can be prepared by reduction of the corresponding amides of Formula (5) by a variety of methods well known to those skilled in the art. For example, reagents such as lithium aluminum hydride, diborane, sodium bis(2-methoxyethoxy)aluminum hydride (Red-Al®), and diisobutylaluminum hydride can be used to reduce an amide to an amine. Such reactions are typically conducted in an appropriate anhydrous aprotic solvent such as ether, toluene or tetrahydrofuran at a temperature from room temperature to the boiling point of the solvent for a period of 2-48 hours.

Alternatively amines of Formula (6), wherein X is NH can be prepared by the route shown in Scheme 2. The primary amines (9) can be prepared by reacting 2-bromoimidazoles of Formula (8) with an appropriately elaborated diamine under neat, thermal conditions or in an appropriate solvent such as N,N-dimethylformamide, toluene, acetonitrile or tetrahydrofuran, at or below the boiling point of the solvent.

Scheme 2



The secondary amines of Formula (6) wherein X is NH can be prepared by direct alkylation of the primary amines of Formula (9) with an appropriately substituted alkyl halide. Or, the secondary amines (6) are prepared by acylation of the primary amines of Formula (9) with an acid chloride or activated carboxylic acid derivative to give the amide of Formula (10) and reduction of the amide (10) to the amines (6) by well known methods previously described.

The compounds of Formula (7) where Y is O and Z is NR^4, OR^4, R^4 are prepared by the reaction of the secondary amines (6) with the requisite isocyanates, chloroformates, acid chlorides, activated urea or activated carboxylic acid derivatives in an appropriate solvent such as hexane, toluene, diethyl ether, diphenyl ether, methylene chloride or tetrahydrofuran at a

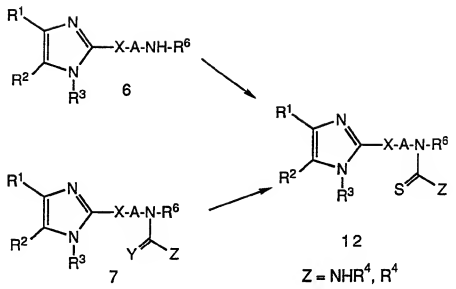
temperature at or below the boiling point of the solvent.

The guanidines of Formula (7), where in Y is NH and Z is NR^4 are prepared by the reaction of the secondary amines (6) with an appropriately substituted S-methyl carbamimidothioate salt (C. R. Rasmussen, F. J. Villani, et al., Synthesis, 460, 1988), in acetonitrile or dioxane at reflux.

The amines of Formula (7), wherein Y is H_2 are prepared by reaction of the corresponding ureas or amides of Formula (7) wherein Y is O, with a reducing agent such as lithium aluminum hydride or other such reagents in an appropriate anhydrous aprotic solvent such as hexane, toluene, diethylether or tetrahydrofuran at temperatures at or below the boiling point of the solvent.

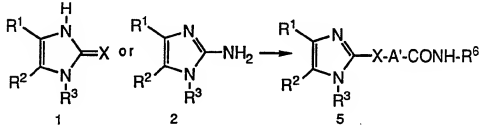
As shown in Scheme 3, the thioureas of Formula (12) wherein X is S, O or NH and Z is NHR^4 can be prepared in an analogous manner by the reaction of the secondary amines of Formula (6) with the requisite isothiocyanate. Alternatively, the thioureas or thioamides where Z is R^4 of Formula (12) can be prepared from the ureas or amides of Formula (7) by the reaction with Lawesson's reagent or diphosphorus pentasulfide in an appropriate solvent such as toluene.

Scheme 3



As shown in Scheme 4, alternatively the amides of Formula (5) can be prepared by the alkylation of (1) or (2) with compounds of the formula M-(A')CONHR^6 wherein M is a halogen or tosylate group, as described for compounds of Formula (3), Scheme 1.

Scheme 4



Alternatively, compounds of Formula (7), where X is O, S, or NH can be prepared by the route shown in Scheme 5. The compounds of Formula (13) can be prepared from a lactone or an hydroxyalkylcarboxylic ester and an appropriate amine, neat or in an inert solvent such as

N,N-dimethylformamide at ambient or elevated temperatures. The amines of Formula (14) are prepared by reduction of the corresponding amide of Formula (13) by a variety of well known methods, as illustrated above. The compounds of Formula (15) are prepared by the reaction of the secondary amine (14) with the requisite isocyanates, chloroformates, acid chlorides, activated ureas or activated carboxylic acid derivatives as described for the preparation of compounds of Formula (7), Scheme 1.

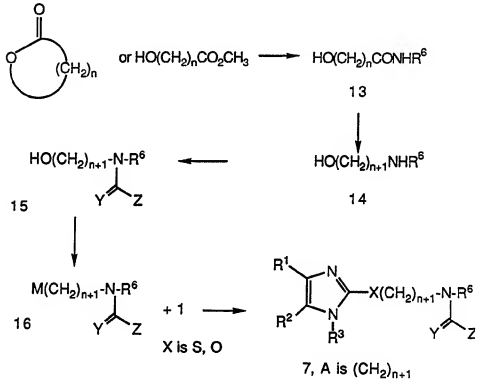
The compounds of Formula (7), wherein A is branched alkyl, can be prepared by a route analogous to that shown in Scheme 5. The requisite lactones with branching substituents can be prepared by functionalization of the parent unsubstituted lactones. Alternatively, branched cyclic α,ω-diacid anhydrides can be reduced to the corresponding branched lactone using agents such as sodium borohydride. Synthesis of compounds of Formula (16) then proceeds exactly as described in the preceding paragraph, and alkylation of compounds of Formula (1) affords compounds of Formula (7), wherein A is branched alkyl.

The compound of Formula (16) can be prepared by conversion of the hydroxy group to a halogen moiety by a variety of well known methods. Examples of these methods are phosphorous tribromide, phosphorous oxychloride, thionyl chloride, or triphenylphosphine and carbon tetrabromide. Or, compounds of Formula (16) where M is a tosylate or similar functionality, can be prepared from toluene sulfonyl chloride and triethylamine, in an appropriate aprotic solvent such as methylene chloride, tetrahydrofuran or toluene.

The compounds of Formula (7) can be prepared by converting the requisite 4-imidazolin-2-one (1) where X

is 0, or 4-imidazolin-2-thione (1) where X is S into the corresponding alkali metal salt by addition of a base such as sodium hydride, and alkylating with the compounds of Formula (16) in a polar aprotic solvent such as N,N-dimethylformamide at an appropriate temperature.

Scheme 5

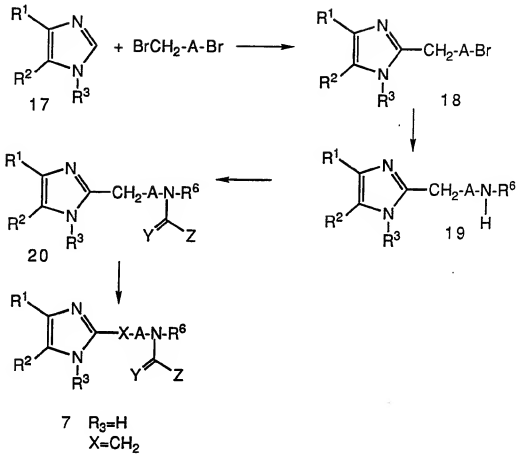


The compounds of Formula (7) wherein X is CH_2 are prepared by the route shown in Scheme 6. The compounds of Formula (18) are prepared by converting the requisite imidazoles of Formula (17) where R^3 is alkyl or an appropriate protecting group, into the corresponding alkali metal salt, by addition of a base such as n-butyl lithium, and alkylating with an appropriate alkyl halide in a solvent such as tetrahydrofuran under an inert

atmosphere and reduced temperatures. The compounds of Formula (19) are prepared from compounds of Formula (18) by reaction with an appropriately substituted amine, in an inert solvent such as toluene, acetonitrile, tetrahydrofuran or N,N-dimethylformamide, at a temperature at or below the boiling point of the solvent. The imidazole compounds of Formula (20) are prepared by the reaction of the secondary amines of Formula (19) with the requisite isocyanate, chloroformate, acid chloride or other activated carboxylic acid derivative as previously described. Or, the imidazole compounds of Formula (20) can be prepared by reacting the alkali metal salt of compounds of Formula (17) with the elaborated compounds of Formula (16) in analogous conditions described above. The compounds of Formula (7) wherein X is CH_2 and R^3 is H, are prepared by deprotecting compounds of Formula (20), where R^3 is a protecting group. For example, when R^3 is a silyl protecting group, removal with tetrabutylammonium fluoride in tetrahydrofuran at reflux, affords compounds of Formula (7) where X is CH_2.

Likewise, compounds of Formula (7) wherein X is O, S, NH or CH_2 and Y is H_2 may be prepared by reacting compounds similar to compounds of Formula (18) with an appropriately functionalized secondary amine, $HNCH_2ZR^6$, in a solvent such as toluene, acetonitrile, tetrahydrofuran, or N,N-dimethylformamide at a temperature at or below the boiling point of the solvent.

Scheme 6

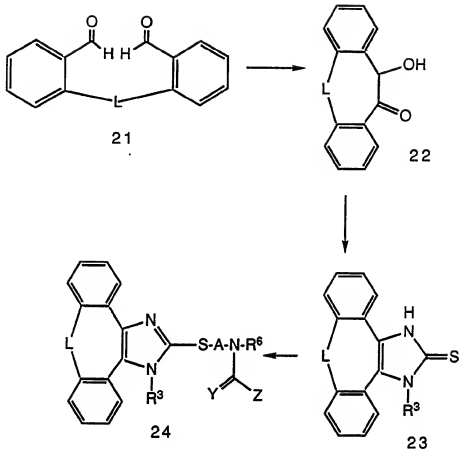


The linked phenyl compounds of Formula (24) are prepared as shown in Scheme 7. The linked bis-benzaldehyde compounds of Formula (21) are prepared by bis alkylation of an appropriately functionalized dihaloalkyl, with a substituted salisaldehyde, using an alkali base, such as sodium hydride in an inert solvent, such as N,N-dimethylformamide. The α-hydroxyketones of Formula (22) are prepared by standard literature benzoin forming reaction conditions, Walter S. Ide, Johannes S. Buck, Organic Reactions, Vol. IV, p. 269, utilizing potassium cyanide in ethanol:water, at reflux.

The imidazoles of Formula (23) are prepared by methods well known in the literature, Klaus Hoffman, The Chemistry of Heterocyclic Compounds, Imidazoles, Part I, by condensing the α-hydroxyketone compounds of Formula (22) with thiourea, or ammonium thiocyanate, or an appropriately substituted thiourea in a suitable solvent such as N,N-dimethylformamide, ethanol or hexanol, at a temperature at or below the boiling point of the solvent.

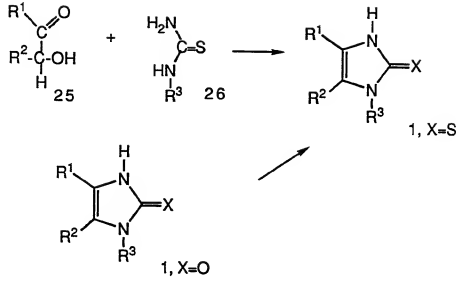
The compounds of Formula (24) are prepared by alkylating the alkali metal salt of imidazole (23) with the compound of Formula (16), as described previously to give the compounds of Formula (24) directly or with a compound of formula $M(A')CO_2R$ when R is CH_3 or C_2H_5, M is halogen or a tosylate group and A' is a moiety having one less methylene group than A, as described in Scheme 1.

Scheme 7



The compounds of Formula (1), Scheme 8, wherein X is S are available from commercial sources or can be prepared by methods as described above.

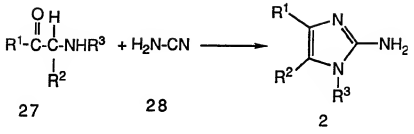
Scheme 8



Alternatively, the compounds of Formula (1) where X is S, Scheme 8, can be prepared from the corresponding 4-imidazolin-2-ones of Formula (1) where X is O, Org. Syn. Coll., Vol. II, 231, by reaction with Lawesson's reagent or diphosphorus pentasulfide in a suitable solvent such as toluene.

As shown in Scheme 9, the 2-aminoimidazoles of Formula (2) can be prepared by the reaction of the appropriately substituted α-aminoketones of Formula (27) with cyanamide (28). Compounds of Formula (2) can be used in the preparation of compounds of Formula (I) as previously described in Scheme 1.

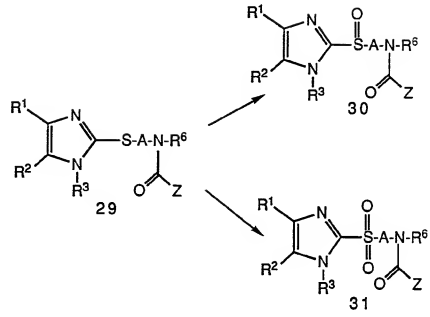
Scheme 9



27 28 2

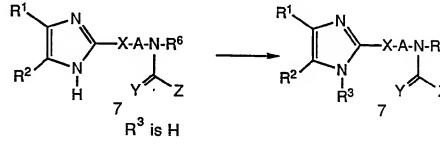
As shown in Scheme 10, the compounds of Formula (I) wherein X is $S(O)_r$ and r is 1 or 2 can be prepared by the oxidation of the compounds of Formula (29) by methods which are well known in the chemical literature. For example, the oxidation of (29) with one equivalent of a peracid such as m-chloroperoxybenzoic acid in a suitable solvent such as methylene chloride at a low temperature affords primarily the sulfoxides of Formula (30), and the oxidation of (29) with an oxidant such as potassium hydrogen persulfate, or Oxone®, in a suitable solvent such as methanol affords the sulfones of Formula (31).

Scheme 10



Alternatively, compounds of Formula (I) where R^3 is not H, Scheme 11, can be prepared by direct alkylation of compounds of Formula (I) when R is H, in the presence or absence of a base such as potassium carbonate, pyridine, sodium hydride, triethylamine, or potassium t-butoxide in an appropriate solvent such as N,N-dimethylformamide, glyme, tetrahydrofuran, pyridine or methylene chloride.

Scheme 11



Preparation of pharmaceutically suitable salts of Formula (I) can be carried out in accordance with well known techniques for forming salts. Physiologically acceptable salts include acid addition salts, e.g., hydrochloric, sulfuric, acetic, trifluoroacetic, succinic, citric, and benzene sulfonic acid salts.

The compounds of this invention and their preparation can be further understood by the following examples, which exemplify but do not constitute a limitation of the invention. In these examples, unless otherwise indicated, all temperatures are in degrees centigrade and parts and percentages are by weight.

EXAMPLE 1

Part C, Method 1. To a solution of 5-(4,5-diphenyl-1H-imidazol-2-ylthio)pentanoic acid (2.0 g, 0.0057 mol) in N,N-dimethylformamide (25 mL) was added 1-hydroxybenzotriazole hydrate (0.93 g, 0.0069 mol) followed by a solution of heptylamine (1.10 mL, 0.86 g, 0.0074 mol) in N,N-dimethylformamide (10 mL). The reaction mixture was cooled to 0° and dicyclohexylcarbodiimide (1.42 g, 0.0069 mol) was added

Part C, Method 2. To a solution of 5-(4,5-diphenyl-1H-imidazol-2-ylthio)pentanoic acid (2.0 g, 0.0057 mol) in toluene (35 mL) was added heptylamine (1.63 mL, 1.27 g, 0.011 mol) and then boron trifluoride etherate (1.35 mL, 1.56 g, 0.011 mol) and the reaction mixture was stirred at reflux for 120 hours using a Dean-Stark moisture trap. The reaction mixture was cooled, extracted with 0.1 N NaOH, 0.1 N HCl, and water, and the combined organic extracts were dried over magnesium sulfate and concentrated under vacuum. The residue was chromatographed and worked-up as described in Part C, Method 1, to give 5-(4,5-diphenyl-1H-imidazol-2-ylthio)-N-heptylpentanamide (2.35 g, 0.005 mol) as a white solid.

The reaction

mixture was cooled to 0°, quenched by the slow and careful sequential addition of water (1.52 mL), 15% sodium hydroxide (4.56 mL), and water (4.56 mL), and then stirred at 0° for 30 minutes. The solution was then dried over magnesium sulfate and concentrated under vacuum, and the residue was chromatographed with a gradient of 1:0 to 3:1 to 1:1 ethyl acetate-methanol. The resulting yellow oil was triturated with cold hexane to give N-[5-(4,5-diphenyl-1H-imidazol-2-ylthio)pentyl]-1-heptanamine as a white solid. Part E. To a solution of N-[5-(4,5-diphenyl-1H-imidazol-2-ylthio)pentyl]-1-heptanamine (1.0 g, 0.0024 mol) in hexane (50 mL) was added, dropwise, a solution of 2,4-difluorophenylisocyanate (0.296 mL, 0.388 g, 0.0025 mol) in hexane (25 mL), and the reaction mixture was stirred at ambient temperature for 3 hours. The reaction mixture was concentrated under vacuum and the residue was chromatographed with 7:3 hexane-ethyl acetate to give the title compound (0.86 g, 0.0015 mol) as a white solid, mp 96-98°. ^{1}H NMR ($CDCl_3$) δ 10.8(s,1H), 7.7-7.1(m,14H), 3.4(t,2H,J=7Hz), 3.2(t,2H,J=7Hz), 3.0(t,2H,J=7Hz), 1.9-1.4(m,16H), 0.9(t,3H,J=8Hz).

EXAMPLE 340

Preparation of 2,4-difluoro-N-[(5-(4,5-diphenyl-1H-imidazol-2-ylthio)pentyl)]-N-heptylbenzeneacetamide

To a solution of N-[5-(4,5-diphenyl-1H-imidazol-2-ylthio)pentyl]-1-heptanamine (2.2 g, 0.005 mol), 1-hydroxybenzotriazole hydrate (0.81 g, 0.006 mol), and 2,4-difluorophenylacetic acid (1.12 g, 0.0065 mol) in N,N-dimethylformamide (50 mL) at 0° was added, portionwise as a solid, dicyclohexylcarbodiimide (1.24 g, 0.006 mol). The reaction mixture was stirred at 0° for 2.5 hours, then at ambient temperature for 72 hours. The solids were filtered and washed with chloroform. The filtrate was concentrated under vacuum and the residue (5.2 g) was chromatographed with 7:3 hexane-ethyl acetate. The resulting solid was triturated with hexane to give the title compound (2.59 g, 0.0044 mol) as a yellow oil. ^{1}H NMR ($CDCl_3$) δ 7.6-7.0(m,11H), 6.8-6.5(m,2H), 3.7(d,2H,J=13.7Hz), 3.5(t,2H,J=6.4Hz), 3.4-3.0(m,3H), 2.9(t,2H,J=6.1Hz), 1.8-1.1(m,17H), 0.9(t,3H,J=6.6Hz).

EXAMPLE 353

Preparation of N-[5-[4,5-bis(4-methoxyphenyl)-1H-imidazol-2-ylthio]pentyl]-2,4-difluoro-N-heptylbenzeneethaneamine

To a solution of lithium aluminium hydride (1 N in tetrahydrofuran, 2 mL) in dry tetrahydrofuran (30 mL), a solution of N-[5-[4,5-bis(4-methoxyphenyl)-1H-imidazol-2-ylthio]pentyl]-2,4-difluoro-N-heptylbenzeneacetamide (0.70 g, 0.00107 mol) in dry tetrahydrofuran (15 mL) was added slowly. The reaction mixture was heated to reflux for 5 hours and was then allowed to cool to ambient temperature. The reaction mixture was poured into a mixture of 10% aqueous sodium sulfate (150 mL) and ice (150 mL). The resultant emulsion was filtered through

Celite® and the filtrate was extracted with ethyl acetate (3 x 100 mL). The organic layer was washed with water, brine, dried over magnesium sulfate and concentrated in vacuo to give a crude oil. The product was purified by flash chromatography on silica gel (100 mL) eluting methanol: methylene chloride (5:95 v:v) to give the title compound as a viscous colorless oil (0.46 g, 0.000723 mol). ^{1}H NMR ($CDCl_3$) δ 9.2-9.15(bs,1H), 7.56-7.25(m,4H), 7.11(m,1H), 6.94-6.70(m,6H), 3.81(m,6H), 3.07(t,2H), 2.74-2.58(m,4H), 2.43(m,4H), 1.71(m,2H), 1.53-1.20(m,14H), 0.91(t,3H).

EXAMPLE 355

Preparation of N-[5-[4,5-bis(4-methoxyphenyl)-1H-imidazol-2-ylthio]pentyl]-N-heptylcyclohexaneacetamide

Part A. Employing the method of Example 118, Part C, but using 2-cyclohexane acetyl chloride, N-heptyl-N-(5-hydroxypentyl)-cyclohexaneacetamide was obtained as an oil (1.5 g, 0.0046 mol). ^{1}H NMR ($CDCl_3$) δ 3.70-3.61(m,2H), 3.37-3.18(m,4H), 2.03(d,2H), 1.97-1.08(m,26H), 1.02-0.86(m,4H).

Part B. Employing the method of Example 118, Part D, but using N-heptyl-N-(5-hydroxypentyl)cyclohexaneacetamide, N-(5-bromopentyl)-N-heptylcyclohexane acetamide was isolated as an oil (1.3 g, 0.00334 mol). ^{1}H NMR ($CDCl_3$) δ 3.47-3.39(m,2H), 3.36-3.18(m,4H), 2.17(d,2H), 1.96-0.86(m,30H).

Part C. Employing the method of Example 118, Part E, but using N-(5-bromopentyl)-N-heptylcyclohexane-acetamide, the title compound was isolated as an oil (0.47 g, 0.00075 mol). ^{1}H NMR (DMSO-d_6) δ 12.34(s,1H), 7.29(d,2H), 6.95(d,2H), 6.84(d,2H), 3.77(s,3H),

EXAMPLE 458

Preparation of N'-(2,4-difluorophenyl)-N-[3,3-dimethyl-5-(4,5-diphenyl-1*H*-imidazol-2-ylthio)pentyl]-N-heptylurea

Part A. The method of Little, R. D. and Muller, G. W., J. Am. Chem. Soc. 1981, 103, p. 2744 was used to prepare 3,3-dimethyl-5-hydroxypentanoic acid lactone. This lactone (12.85 g, 100.3 mmol) was dissolved in toluene (100 mL) under nitrogen atmosphere, and treated with heptylamine (17.0 mL, 115 mmol). After refluxing for 18 hours, the mixture was cooled, washed with an equal volume aq. hydrochloric acid (1 N), dried over magnesium sulfate, and concentrated under vacuum. The product was purified by elution through a plug of silica gel with ethyl acetate, and the eluant was concentrated under vacuum to afford N-heptyl-3,3-dimethyl-5-hydroxy-pentanamide (24.0 g, 98.7 mmol, 98%) as an oil. ^{1}H NMR ($CDCl_3$) δ 6.32(br s,1H); 3.78(t,2H,J=5.7Hz); 3.22(q,2H,J=6.7Hz); 2.25(s,2H); 1.67(t,2H,J=5.7Hz); 1.57-1.45(m,2H); 1.38-1.25(m,8H); 1.02(s,6H); 0.88(t,3H,J=7.0Hz).

Part B. A slurry of lithium aluminum hydride (5.50 g, 145 mmol) in tetrahydrofuran (100 mL) was cooled to 0°C, and a solution of the amide prepared in Part A (11.48 g, 47.2 mmol) in tetrahydrofuran (50 mL) was added dropwise over 1 hour. The ice bath was removed, and the mixture was heated to reflux for 18 hours. After cooling to 0°C, the mixture was quenched by the slow dropwise addition of water (6 mL), aq. NaOH (18 mL, 15%), and water (18 mL). The solution was filtered through a plug of Celite®, dried over potassium carbonate, and concentrated under vacuum to afford N-heptyl-3,3-dimethyl-5-hydroxypentanamine as a clear, colorless oil

(7.61 g, 33.2 mmol, 70%). ^{1}H NMR ($CDCl_3$) δ 3.70(dt,2H,J=10.2,7.0Hz); 2.70-2.55(m,2H); 2.39-2.29(m,2H); 1.56(dt,2H,J=12.1,7.0Hz); 1.51-1.41(m,6H); 1.36-1.24(m,8H); 0.91(s,6H); 0.88(t,3H,J=6.9Hz).

Part C. A solution of the amine prepared in Part C (4.26 g, 18.6 mmol) in methylene chloride (20 mL) was cooled to 0°C, and a solution of 2,4-difluorophenyl isocyanate (2.20 mL, 18.6 mmol) in methylene chloride (20 mL) was added dropwise with stirring over 1 hour. After slow warming to ambient temperature over 18 hours, the reaction mixture was concentrated under vacuum, and the residual oil was purified by flash chromatography to afford N'-(2,4-difluorophenyl)-N-(3,3-dimethyl-5-hydroxypentyl)-N-heptylurea as a colorless oil (2.31 g, 6.01 mmol, 32%). ^{1}H NMR ($CDCl_3$) δ 7.93(br q,1H,J=6.2Hz); 6.89-6.78(m,3H); 3.76(t,2H,J=6.3Hz); 3.38-3.24(m,4H); 2.36(br s,1H); 1.65-1.52(m,6H); 1.36-1.24(m,8H);0.97(s,6H); 0.89(t,3H,J=6.6Hz).

Part D. A solution of the alcohol prepared in Part C (2.05 g, 5.33 mmol) in methylene chloride (30 mL) was cooled to 0°C and treated with solid carbon tetrabromide (2.14 g, 6.45 mmol). Then, a solution of triphenylphosphine (1.69 g, 6.44 mmol) in methylene chloride (20 mL) was added dropwise. After stirring for 18 hours, the mixture was concentrated under vacuum and purified by flash chromatography to afford N'-(2,4-difluorophenyl)-N-(5-bromo-3,3-dimethylpentyl)-N-heptylurea as a clear, colorless oil (1.68 g, 3.75 mmol, 70%). ^{1}H NMR ($CDCl_3$) δ 8.10-8.02(m,1H); 6.88-6.80(m,2H); 6.37(br d,1H,J=3.3Hz); 3.44-3.38(m,2H); 3.36-3.24(m,4H); 1.93-1.85(m,2H); 1.70-1.55(m,4H); 1.40-1.25(m,8H); 0.98(s, 6H); 0.89(t, 3H,J=7.0Hz).

Utility

The compounds of the present invention are inhibitors of the enzyme acyl-CoA: cholesterol acyltransferase and are thus effective in inhibiting esterification and transport of cholesterol across the intestinal wall. In addition, the compounds are useful in preventing the formation of cholesterol ester rich macrophages (foam cells) in the arterial wall through the inhibition of cholesterol ester formation. Foam cells are a source of the large quantity of cholesterol ester found in atheromatous lesions as opposed to the surrounding undiseased tissue. Thus inhibition of ACAT would decrease the accumulation and storage of cholesterol esters in the arterial wall and prevent or inhibit the formation of atheromatous lesions.

A. Assay of the Inhibition of Acyl-CoA: Cholesterol Acyltransferase (ACAT) in Hepatic Microsomes

The ability of the compounds to inhibit ACAT, the enzyme responsible for the intracellular synthesis of cholesteryl esters, was tested as follows. Male Sprague Dawley rats weighing 150-300 g, were fed rat chow ad libitum. The animals were fasted for twenty-four hours prior to being sacrificed by decapitation. The livers

were perfused in situ with 50 ml of cold 0.25 M sucrose, excised, and homogenized in three volumes of 0.1 M phosphate buffer, pH 7.4, that contained 0.5 mM EDTA (ethylenediaminetetraacetic acid), 1.0 mM glutathione, 0.25 M sucrose and 20 mM leupeptin. Microsomes were obtained by differential centrifugation; the supernatant from an initial spin at 15,000 x g for 15 minutes was centrifuged at 105,000 x g for 1 hour to pellet the microsomes. The microsomes were suspended in homogenization buffer, reisolated by centrifugation, and stored at -70°C. Microsomes were used within one month of preparation.

The control assay in a final volume of 200 µl consisted of 200 µg of microsomal protein, 75 µM ^{14}C-oleoyl-CoA (10,000 dpm/nmol) in 0.1 M phosphate, pH 7.4, that contained 1 mM glutathione. Compounds were added in 5 µl of DMSO (dimethyl sulfoxide) and additional controls were run with DMSO only. All components, except the oleoyl-CoA, were preincubated for 15 min. at 37°C prior to the initiation of the reaction by the addition of oleoyl-CoA. The assay was terminated after 10 min by the addition of 4 ml of chloroform:methanol (2:1, v/v). 20,000 dpm of ^{3}H-cholesteryl oleate and 10 µg of unlabeled cholesteryl oleate and oleic acid were added as an internal standard and carriers, respectively. After allowing 10 min. for lipid extraction, the samples were centrifuged at 1,000 x g for 10 min. to separate the solvent layers. The chloroform layer containing the neutral lipids was spotted onto a Baker SI250-Pa silica gel TLC plate and the plate developed using a hexane: diethyl ether: acetic acid (170:30:1 v/v/v) mobile phase. The lipids were visualized by their interaction with iodine vapor and the cholesteryl ester spot was scraped into a scintillation vial and counted. The specific activity

of ACAT in the control incubation averaged 260 pmol/min/mg microsomal protein. The inhibition of ACAT activity by the compounds is shown in Table 6; the data are expressed as the concentration at which ACAT activity is inhibited by 50% (IC_{50}).

B. Assay of the Inhibition of Cholesterol Esterification in Mammalian Cells

The esterification of cholesterol was determined in the murine macrophage-like cell line J774.A1. Cells were seeded in 35 mm wells at a density of 300,000 cells per well in 2 mls of Dulbecco's Eagle Medium (DMEM) supplemented with 10% fetal bovine serum (FBS). Cells were incubated at 37°C in an atmosphere of 5% CO_2 and 93% humidity. After 24 hours the media was changed to 0.68 mls 10% FBS-DMEM containing 34 µg of acetylated human low density lipoprotein (ac-LDL) to increase the intracellular concentration of cholesterol and promote esterification. At 41 hours, various inhibitors were added to the cells in DMSO (10 µl/ml maximum). At 43 hours, the cells were pulsed with 0.1 mM ^{14}C-oleic acid (10,000 dpm/nmol) complexed with BSA (bovine serum albumin) to follow cholesterol ester formation. The experiment was terminated at 45 hours by washing the monolayers 3 times with 3 ml of Tris-buffered saline at 4°C. The lipids were extracted by incubating the monolayers with 1.5 ml of hexane: isopropanol (3:2, v/v) for 30 min. under gentle agitation. During this period, 10,000 dpm ^{3}H-cholesteryl linoleate and 10 µg of cholesteryl oleate were added as an internal standard and carrier respectively. The organic solvent was removed and the cells were washed with an additional 1.0 ml of hexane: isopropanol which was combined with the original extract. The cells were allowed to dry overnight, digested with 1.5 ml of 0.2 N sodium hydroxide for 1 hour and an aliquot of the solubilized

protein used for protein determination using the Lowry method. The organic extract was taken to dryness, the residue resuspended in 100 µl of chloroform and the lipids separated on silica gel impregnated glass fiber plates using a hexane: diethylether: acetic acid (170:30:1, v/v/v) solvent system. Individual lipids were visualized with iodine and the cholesteryl ester spot cut out and transferred to scintillation vials to determine the amount of radioactivity. The conversion of oleic acid to cholesteryl ester in the control averaged 0.54 mmol/hour/mg protein and was increased upon the addition of ac-LDL to about 10.69 ± 0.69 mmol/hour/mg protein. The inhibition of esterification by the compounds is shown in Table 7; the data are expressed as the concentration at which ACAT activity is inhibited by 50% (IC_{50}). It should be noted that many of the intermediates had inhibitory activity in the in vitro ACAT assay and in the macrophage assay. For example, N-[5(4,5-diphenyl-1H-imidazol-2-ylthio)pentyl]-1-heptanaminehydrochloride had IC_{50}'s of 100 nM and 6 µM in the in vitro ACAT and macrophage assay, respectively.

C. Assay of Antihypercholesterolemic Activity in Cholesterol-fed Hamsters

Inhibition of ACAT activity in the gut reduces the absorption of cholesterol in cholesterol-fed animals. Hamsters weighing approximately 100 g, were maintained on a diet supplemented with 0.8% cholesterol. The treatment group received 1-100 mg/kg/day, p.o., of the test compound dissolved in 500 µl of corn oil for a period of two weeks. The control group were pair-fed to the treatment group and were dosed with 500 µl of the corn oil vehicle. At sacrifice, the hamsters were anesthetized with CO_2 and exsanguinated via cardiac puncture. Total serum cholesterol was determined on a Du Pont aca® IV. The data were expressed in terms of mg

cholesterol per 100 ml of serum (mg %). The antihyper-cholesterolemic activity of the compound of Example 1 is shown in Table 8.

Dosage Forms:

The compounds of the present invention can be administered orally using any pharmaceutically acceptable dosage form known in the art for such administration. The active ingredient can be supplied in solid dosage forms such as dry powders, granules, tablets or capsules, or in liquid dosage forms, such as syrups or aqueous suspensions. The active ingredient can be administered alone, but is generally administered with a pharmaceutical carrier. A valuable treatise with respect to pharmaceutical dosage forms is Remington's Pharmaceutical Sciences, 16th Edition, 1980.

In their therapeutic use as antihypercholesterolemic and/or antiatherosclerotic agents, the compounds of the invention are administered to the patient at dosage levels of 1 to 28 g per day. For a normal male adult human of approximately 70 kg of body weight, this translates into a dosage of 14 to 400 mg per kilogram body weight per day. The dosage administered will, of course, vary depending upon known factors such as the age, health, and weight of the

recipient; nature and extent of symptoms, kind of concurrent treatment, frequency of treatment, and the effect desired. Useful pharmaceutical dosage forms for administration of the compounds of this invention can be illustrated as follows:

Tablets

Tablets are prepared by conventional procedures so that the dosage unit is 500 milligrams of active ingredient, 150 milligrams of lactose, 50 milligrams of cellulose and 10 milligrams of magnesium stearate.

Capsules

Capsules are prepared by conventional procedures so that the dosage unit is 500 milligrams of active ingredient, 100 milligrams of cellulose and 10 milligrams of magnesium stearate.

V. ☐ OBSERVATIONS WHERE CERTAIN CLAIMS WERE FOUND UNSEARCHABLE [1]

This international search report has not been established in respect of certain claims under Article 17(2) (a) for the following reasons:

1. ☐ Claim numbers . . . . , because they relate to subject matter [12] not required to be searched by this Authority, namely:

2. ☐ Claim numbers . . . . . , because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out [13], specifically:

3. ☐ Claim numbers _____, because they are dependent claims not drafted in accordance with the second and third sentences of PCT Rule 6.4(a).

VI. ☒ OBSERVATIONS WHERE UNITY OF INVENTION IS LACKING [2]

This international Searching Authority found multiple inventions in this international application as follows:

See the attached PCT telephone memo for lack of Unity of Invention.

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims of the international application.

2. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims of the international application for which fees were paid, specifically claims:

3. ☒ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claim numbers:

1-8,21,23,28,33-40,53,55,60,65-72,85,87,92-in-part

4. ☐ As all searchable claims could be searched without effort justifying an additional fee, the International Searching Authority did not invite payment of any additional fee.

Remark on Protest

☐ The additional search fees were accompanied by applicant's protest.

☐ No protest accompanied the payment of additional search fees.
